## Introducing the **CAMS Upgrade**

Your company can get the benefits of C.A.M.S. (Computer Assisted Measuring System) technology by upgrading the microhardness tester you already own. Even using the most basic C.A.M.S. model, operators will spend less time and measure impressions more accurately. Using more advanced C.A.M.S. options, especially for case depth testing, an operator can reduce labor costs more significantly.

The C.A.M.S. system can retrofit almost any model:

<b>Leco</b>	<b>Mitutoyo</b>	<b>Wilson</b>
<b>Buehler</b>	<b>Clark</b>	<b>ATS</b>
<b>Shimadzu</b>	<b>Future-Tech</b>	

Any operator who can use a computer mouse can achieve accurate and consistent results with C.A.M.S. simple software. The basic system provides point and click measurement of the test impression. Viewing the impression and positive positioning of the filars is easier on a computer screen than it is through an eyepiece. When an automatic measurement option is used, it eliminates all operator influence and is even easier to operate. Other features for automatic traverse testing can add more value, depending on your application.

### **Special Features:**

- Clear cut on screen test impressions for greater accuracy
- Reduced eyestrain and neck strain
- Instant, error-free data recording, charting and retrieval
- Many options for manual to automatic traverse testing
- Lower cost than buying similar features on a new tester
- Rapid payback from dramatically increased productivity
- A variety of metallographic image analysis options
- Add software and hardware options as your needs increase

United Service Company Inc is an ISO-17025 certified company with well over 100 years combined experience providing service and recommending the correct machine for your needs. Our major objective is to supply to our customers the best products, advice, and on-time service possible.
